Assessments of Academic Readiness (STAAR)  
End-of-Course (EOC) Assessments Based on NWEA  
MAP Growth Scores**

August 2024

NWEA Psychometrics and Analytics

## Linking Study Updates

Date	Description
2020-07-24	Initial study was conducted for Texas End-of-Course (EOC) for Algebra I using Spring 2019 data incorporating the 2020 MAP Growth norms.
2022-11-30	Incorporated EOC English I, English II, and Biology. NWEA norms are not yet available for Biology.
2024-07-31	Updated the linking study for EOC assessments using Spring 2023 data due to the state assessment redesign.

**Acknowledgments:** This report was made possible with the contributions of Ann Hu, Yan Zhou, Christopher Wells, and Derek May. We appreciate our colleagues at NWEA and all our partners who provided data for the study.

## Executive Summary

Linking studies allow partners to use MAP® Growth™ Rasch Unit (RIT) scores throughout the year to predict their students' performance levels on state summative assessments. This is accomplished through statistical analyses that produce RIT cut scores that correspond to state summative performance levels. A “cut score” is the minimum score a student must get on a test to be placed at a certain performance level. The linking study for the State of Texas Assessments of Academic Readiness (STAAR) End-of-Course (EOC) described in this report provides RIT cut scores for the fall, winter, and spring MAP Growth administrations that correspond to the STAAR performance levels for each subject and grade. Educators can use the RIT cut scores to identify students at risk of not meeting state proficiency standards and provide targeted instruction to improve academic outcomes.

The linking study is based on test scores from students who took the MAP Growth Mathematics 6+, Algebra I, Biology, and Reading 6+ tests as well as the corresponding STAAR EOC Algebra I, Biology, English I, and English II tests in Spring 2023. In total, this study included 14,758 students from 103 schools within 43 districts in Texas.

Prior to initiating the linking analyses, NWEA confirmed that the content standards used to construct the MAP Growth interim assessments were aligned with those of the STAAR EOC, thus warranting a connection. Further investigation into the relationship between MAP Growth and STAAR EOC involved calculating correlation coefficients to illustrate the association between the MAP Growth scores and the summative test scores of STAAR. A high positive correlation (e.g.,  $\geq 0.70$ ) shows that students who perform well on one assessment also tend to perform well on the other, and vice versa, with 1.00 being a perfect positive correlation. The correlations between the MAP Growth and STAAR EOC test scores in all subjects are at or higher than 0.70, indicating that MAP Growth is a good assessment for predicting performance on the STAAR spring summative assessment.

**Figure E.1. Correlation Between STAAR EOC and MAP Growth Tests**

The equipercentile linking method and the MAP Growth norms (He, 2022; Thum & Kuhfeld, 2020) were then used to produce the RIT cut scores that correspond to performance levels on the STAAR EOC assessment for every subject and grade. While RIT cut scores were generated

for every performance level on the STAAR EOC assessment, Table E.1 presents the *Meets Grade Level* cut scores that indicate the minimum score a student must get to be considered proficient. Details regarding reported grades and cut scores are provided in MAP Growth Cut Scores.

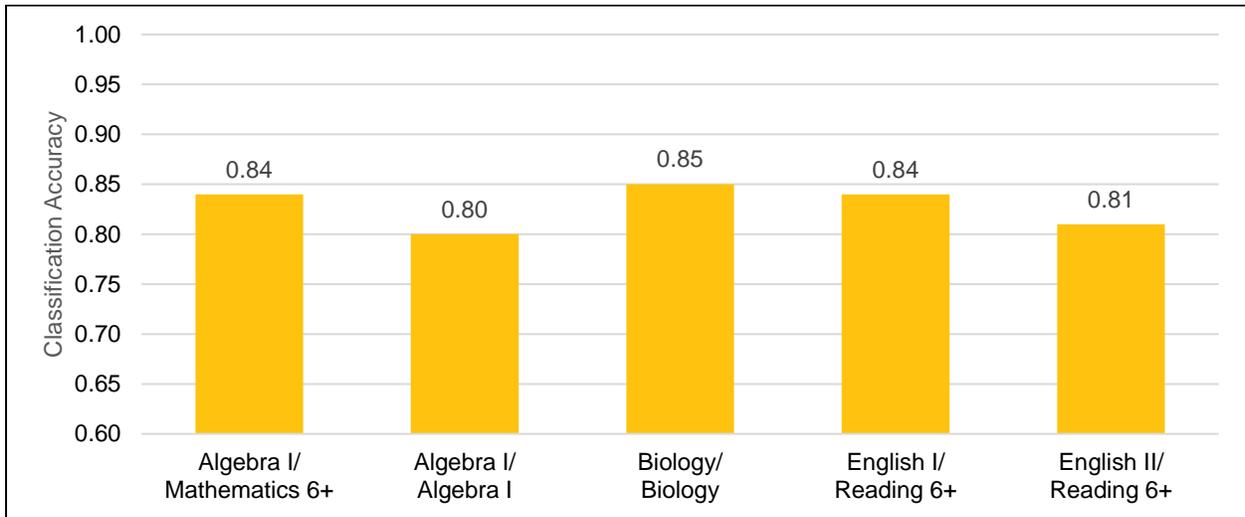

**Table E.1. MAP Growth RIT Cut Scores for STAAR EOC Proficiency**

Assessment			Cut Score by Grade					
			7	8	9	10	11	12
STAAR Algebra I Spring			4000					
MAP Growth	Mathematics 6+	Fall	227	229	231	231	–	–
		Winter	231	232	233	233	–	–
		Spring	234	234	234	234	–	–
STAAR Algebra I Spring			4000					
MAP Growth	Algebra I	Fall	226					
		Winter	230					
		Spring	234					
STAAR Biology Spring			4000					
MAP Growth	Biology	Fall	211					
		Winter	213					
		Spring	215					
STAAR English I Spring			4000					
MAP Growth	Reading 6+	Fall	–	211	212	212	213	213
		Winter	–	214	214	214	214	214
		Spring	–	215	215	215	215	215
STAAR English II Spring			4000					
MAP Growth	Reading 6+	Fall	–	214	215	215	216	216
		Winter	–	217	217	217	217	217
		Spring	–	218	218	218	218	218

Educators can use these cut scores to determine whether students are on track for proficiency on the state assessment. For example, the *Meets Grade Level* cut score on the STAAR EOC Algebra I test is 4000. A grade 7 student with a MAP Growth Mathematics 6+ RIT score of 227 in the fall is likely to meet proficiency on the STAAR EOC Algebra I test in the spring, whereas a grade 7 student with a RIT score lower than 227 in the fall is in jeopardy of not meeting proficiency.

As further evidence that MAP Growth scores can be used to predict students' proficiency on the state tests, NWEA calculated classification accuracy statistics that show how well the RIT scores correctly classified, or predicted, students as *Meets Grade Level* on the STAAR EOC tests. A high statistic indicates high accuracy. Across the subject areas, the MAP Growth assessments have at least a 0.80 classification accuracy rate, meaning they accurately predicted student proficiency on the state tests for 80% or more of the sample. These results indicate that MAP Growth scores have a high accuracy rate of identifying student proficiency on the STAAR EOC Algebra I, Biology, English I, and English II tests that are the focus of this report, as illustrated in Figure E.2.

**Figure E.2. Classification Accuracy of MAP Growth Tests**

**Please note** that the purpose of this report is to explain NWEA's linking study methodology. It is not meant as the main reference for determining a student's likely performance on the state summative assessment. The cut scores in this report are based on the default instructional weeks most encountered for each term (i.e., Weeks 4, 20, and 32 for fall, winter, and spring, respectively), whereas instructional weeks often vary by district. The cut scores in this report may therefore differ from the results in the NWEA reporting system that reflect the specific instructional weeks set by partners. Partners should therefore reference their MAP Growth score reports instead.

# 1. Introduction

## 1.1. Purpose of the Study

NWEA® is committed to providing partners with useful tools to help make inferences about student learning from MAP® Growth™ test scores. One important use of MAP Growth results is to predict a student's performance on state summative assessments at different times throughout the year. This allows educators and parents to determine if a student is on track in their learning to meet state standards by the end of the year or, given a student's learning profile, is on track to obtain rigorous, realistic growth in their content knowledge and skills.

This document presents results from a linking study conducted by NWEA to statistically connect the scores of the State of Texas Assessments of Academic Readiness (STAAR) End-of-Course (EOC) Algebra I, Biology, English I, and English II tests with Rasch Unit (RIT) scores from the MAP Growth Mathematics 6+, Algebra I, Biology, and Reading 6+ tests. Specifically, this report presents the following results:

1. Student sample demographics
2. Descriptive statistics of test scores
3. MAP Growth cut scores from fall, winter, and spring that correspond to the performance levels on the spring STAAR EOC assessment
4. Classification accuracy statistics to determine the degree to which MAP Growth accurately predicts student proficiency status on the STAAR EOC tests
5. The probability of achieving grade-level proficiency on the STAAR EOC assessment based on MAP Growth RIT scores from fall, winter, and spring

## 1.2. Assessment Overview

The STAAR EOC tests are part of Texas's state summative assessment system aligned to the Texas Essential Knowledge and Skills (TEKS) curriculum. Based on their test scores, students are placed into one of four performance levels: *Did Not Meet Grade Level*, *Approaches Grade Level*, *Meets Grade Level*, and *Masters Grade Level*. The *Meets Grade Level* cut score demarks the minimum level of performance considered to be proficient for accountability purposes.

MAP Growth tests are adaptive interim assessments aligned to state-specific content standards and administered in the fall, winter, and spring. Scores are reported on the RIT vertical scale with a range of 100 to 350. To aid the interpretation of scores, NWEA conducts norming studies of student and school performance on MAP Growth. Growth norms provide expected score gains across test administrations (e.g., the relative evaluation of a student's growth from fall to spring), which are used to conduct the linking studies. The most recent norms study was conducted in 2020 (Thum & Kuhfeld, 2020) for the general mathematics and reading tests. The norms study for the MAP Growth course-specific tests was conducted and published in December 2022 (He, 2022).

## 2. Methods

### 2.1. Data Collection

This linking study is based on data from the Spring 2023 administration of the MAP Growth and STAAR EOC assessments. Each student's state testing record was matched to their MAP Growth score based on the student's state identifier. Only students who have scores on both the MAP Growth and STAAR EOC summative assessments in Spring 2023 were included in the study sample.

### 2.2. Post–Stratification Weighting

Post–stratification weights were applied to the calculations to ensure that the linking study sample represented the state's test–taking student population in terms of race, sex, and performance level. These variables were selected because they are known to be correlated with students' academic achievement and are often available in state summative assessment reports. The weighted sample will match the target population as closely as possible for the key demographics and performance characteristics defined by the state.

A raking procedure was used to calculate the post–stratification weights that either compensate for the underrepresentation of certain groups or attenuate the overrepresentation of certain groups. Raking uses iterative procedures to obtain weights that match sample marginal distributions to known population margins. The following steps were taken during this process:

1. Calculate marginal distributions of race, sex, and performance level for the sample and population.
2. Calculate post–stratification weights with the rake function from the survey package in R (Lumley, 2019).
3. Apply the weights to the sample before conducting the linking study analyses.

### 2.3. Descriptive Statistics

Descriptive statistics are provided to summarize the test scores for both the MAP Growth and STAAR EOC assessments, including the test score mean, standard deviation (SD), minimum, and maximum. The mean presents the average test scores across all students in the study sample, and the SD indicates the variability of test scores, revealing how students' scores are distributed around the average score, or mean. Correlation coefficients between the MAP Growth RIT scores and STAAR EOC scores are also provided to answer the question “How well do the test scores from MAP Growth (that reference the RIT scale) correlate to the scores obtained from the STAAR EOC tests (that reference some other scale) in the same subject?” The correlations were calculated as:

$$r = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum (x_i - \bar{x})^2 \sum (y_i - \bar{y})^2}}$$

where  $r$  is the correlation coefficient,  $x_i$  and  $y_i$  are the values of the  $x$  and  $y$  variables in a sample, and  $\bar{x}$  and  $\bar{y}$  are the mean of the values of the  $x$  and  $y$  variables.

## 2.4. MAP Growth Cut Scores

MAP Growth cut scores that predict student achievement on the STAAR EOC Algebra I, Biology, English I, and English II assessments are reported. Since the state EOC tests are not grade dependent (i.e., any student can take the assessment once they finish the course), the spring RIT cuts were established based on all the students in the study sample regardless of their grade. Fall and winter RIT cut scores were then projected using the growth norms and the spring RIT cuts. The RIT cuts for grades 7–10 mathematics and grades 8–12 reading were reported because it is common for students in these grade ranges to take the STAAR EOC Algebra I, English I, and English II tests. The growth norms from fall or winter to spring are grade specific for the MAP Growth Mathematics 6+ and Reading 6+ tests; therefore, the corresponding RIT cut scores varied across grades. In contrast, the growth norms for the MAP Growth Algebra I and Biology tests are available for fall or winter to spring projections for all eligible grades combined. Therefore, the fall and winter RIT cuts were reported independent of grade level.

Percentile ranks based on the NWEA norms are also provided. These are useful for understanding how students' scores compare with peers nationwide and the relative rigor of a state's performance level designations for its summative assessment.

The equipercentile linking method (Kolen & Brennan, 2004) was used to identify the spring MAP Growth RIT scores that correspond to the spring STAAR EOC performance level cut scores. The equipercentile linking procedure matches scores on the two scales that have the same percentile rank (i.e., the proportion of tests at or below each score). For example, let  $x$  represent a score on Test  $X$  (e.g., STAAR). Its equipercentile equivalent score on Test  $Y$  (e.g., MAP Growth),  $e_y(x)$ , can be obtained through a cumulative–distribution–based linking function defined as:

$$e_y(x) = G^{-1}[P(x)]$$

where  $e_y(x)$  is the equipercentile equivalent of score  $x$  on STAAR on the scale of MAP Growth,  $P(x)$  is the percentile rank of a given score on STAAR, and  $G^{-1}$  is the inverse of the percentile rank function for the scores on the MAP Growth scale. The inverse function finds the score on MAP Growth that corresponds to a given percentile rank. Polynomial loglinear pre–smoothing was applied to reduce irregularities of the score distributions and equipercentile linking curve.

The MAP Growth conditional growth norms provide students' expected score gains across terms, such as growth from fall to spring within the same grade or from spring of a lower grade to spring of the adjacent higher grade. This information was used to calculate the fall and winter cut scores. The equation below was used to determine the previous term's or grade's MAP Growth score needed to reach the spring cut score, considering the expected growth associated with the previous RIT score:

$$RIT_{PredSpring} = RIT_{previous} + g$$

where:

- $RIT_{PredSpring}$  is the predicted MAP Growth spring score,
- $RIT_{previous}$  is the previous term's or grade's RIT score, and
- $g$  is the expected growth from the previous RIT (e.g., fall or winter) to the spring RIT score.

## 2.5. Classification Accuracy

The degree to which MAP Growth predicts student proficiency status on the STAAR EOC tests can be described using classification accuracy statistics based on the MAP Growth spring RIT cut scores. The results show the proportion of students correctly classified by their RIT scores as proficient (i.e., *Meets Grade Level*) or not proficient on the STAAR EOC tests. Table 2.1 describes the classification accuracy statistics provided in this report (Pommerich et al., 2004).

**Table 2.1. Description of Classification Accuracy Summary Statistics**

Statistic	Description	Interpretation
Overall Classification Accuracy Rate	$(TP + TN) / (\text{total sample size})$	Proportion of the study sample whose proficiency classification on the state test was correctly predicted by MAP Growth cut scores
False Negative (FN) Rate	$FN / (FN + TP)$	Proportion of students identified by MAP Growth as not proficient in those observed as proficient on the state test
False Positive (FP) Rate	$FP / (FP + TN)$	Proportion of students identified by MAP Growth as not proficient in those observed as not proficient on the state test
Sensitivity	$TP / (TP + FN)$	Proportion of students identified by MAP Growth as proficient in those observed as such on the state test
Specificity	$TN / (TN + FP)$	Proportion of students identified by MAP Growth as not proficient in those observed as such on the state test
Precision	$TP / (TP + FP)$	Proportion of students observed as proficient on the state test in those identified as such by the MAP Growth test
Area Under the Curve (AUC)	Area under the receiver operating characteristics (ROC) curve	How well MAP Growth cut scores separate the study sample into proficiency categories that match those from the state test cut scores. An AUC at or above 0.80 is considered “good” accuracy.

Note. FP = false positives; FN = false negatives; TP = true positives; TN = true negatives.

## 2.6. Proficiency Projections

Given that all test scores contain measurement errors, reaching the *Meets Grade Level* RIT cut does not guarantee that the student is proficient on the state test. Instead, it can be claimed that a student meeting the RIT cut score has a 50% chance of reaching proficiency on the state test, with their chances increasing the greater their score is from the cut. The proficiency projections indicate these probabilities for various RIT scores throughout the year.

In addition to calculating the MAP Growth fall and winter cut scores, the MAP Growth conditional growth norms data were also used to calculate the probability of reaching proficiency on the STAAR EOC tests based on a student’s RIT scores from fall and winter:

$$Pr(\text{Achieving proficiency in spring} | \text{starting RIT}) = \Phi \left( \frac{RIT_{previous} + g - RIT_{SpringCut}}{SD} \right)$$

where:

- $\Phi$  is the standard normal cumulative distribution function,
- $RIT_{previous}$  is the student’s RIT score in fall or winter,
- $g$  is the expected growth from the previous RIT (e.g., fall or winter) to the spring RIT,
- $RIT_{SpringCut}$  is the MAP Growth *Meets Grade Level* cut score for spring, and
- $SD$  is the conditional standard deviation of the expected growth,  $g$ .

The equation below was used to estimate the probability of a student achieving *Meets Grade Level* performance on the STAAR EOC tests based on their spring RIT score ( $RIT_{spring}$ ):

$$Pr(\text{Achieving proficiency in spring} \mid \text{spring RIT}) = \Phi\left(\frac{RIT_{spring} - RIT_{springCut}}{SE}\right)$$

where  $SE$  is the standard error of measurement for MAP Growth.

### 3. Results

#### 3.1. Study Sample

The data used in this study were collected from 43 districts and 103 schools across Texas in Spring 2023. Only students who took both the MAP Growth and STAAR EOC assessments were included in the study sample. Table 3.1 presents the distributions of students by race, sex, and performance level in the original unweighted study sample. Table 3.2 presents the distributions of the target population of students who took the STAAR EOC tests. Since the student distributions in the original study sample are different from the target STAAR population, post-stratification weights were applied to improve the sample representativeness. Table 3.3 presents the demographic distributions of the sample after weighting, which are almost identical to the STAAR student population distributions. The analyses in this study were conducted using the weighted sample.

### 3.2. Descriptive Statistics

Table 3. presents descriptive statistics of the MAP Growth and STAAR EOC test scores from Spring 2023, including the correlation coefficients ( $r$ ) between them. The coefficients between the scores range from 0.70 to 0.84. These values indicate a high positive correlation between the scores, which is important validity evidence for the claim that MAP Growth scores are good predictors of performance on the STAAR EOC assessment.

**Table 3.4. Descriptive Statistics of Test Scores**

Test	N	$r$	Mean	SD	Min.	Max.
STAAR Algebra I MAP Growth Mathematics 6+	1,916	0.74	3996.8 231.1	556.2 18.8	1500 172	6430 280
STAAR Algebra I MAP Growth Algebra I	3,697	0.70	3945.9 231.1	484.2 18.5	1500 176	5694 285

STAAR English II MAP Growth Reading 6+	4,852	0.73	4071.5 217.7	462.9 19.1	1650 158	6050 276

Note. SD = standard deviation; Min. = minimum; Max. = maximum.

### 3.3. MAP Growth Cut Scores

Table 3.5–Table 3.9 present the STAAR EOC scale score ranges and the corresponding MAP Growth RIT cut scores and percentile ranges. Bold numbers indicate the cut scores considered to be at least proficient. These tables can be used to predict a student’s likely performance level on the STAAR EOC spring assessment when MAP Growth is taken in the fall, winter, or spring. For example, a grade 7 student who obtained a MAP Growth mathematics RIT score of 227 in the fall is likely to achieve *Meets Grade Level* performance on the STAAR EOC Algebra I test. The spring cut score is higher than the fall cut score because growth is expected between fall and spring as students receive more instruction during the school year.

Within this report, the cut scores for fall and winter are derived from the spring cuts and the typical growth scores from fall to spring or winter to spring. The typical growth scores are based on the default instructional weeks most encountered for each term (i.e., Weeks 4, 20, and 32 for fall, winter, and spring, respectively). Since instructional weeks often vary by district, the cut scores in this report may differ slightly from the MAP Growth score reports that reflect instructional weeks set by partners. If the actual instructional weeks deviate substantially from the default ones, a student’s expected performance level could be different from the projections presented in this document. Partners are therefore encouraged to use the projected performance level in students’ score reports since these reflect the specific instructional weeks set by partners.

**Table 3.5. Cut Scores—STAAR EOC Algebra I & MAP Growth Mathematics 6+**

STAAR Algebra I									
Level	<i>Did Not Meet</i>		<i>Approaches</i>		<i>Meets</i>		<i>Masters</i>		
Scale Score	1500–3549		3550–3999		4000–4344		4345–6430

### 3.4. Classification Accuracy

Table 3.10 presents the classification accuracy summary statistics, including the overall classification accuracy rates. These results indicate how well MAP Growth spring RIT scores predict proficiency on the STAAR EOC tests, providing insight into the predictive validity of MAP Growth. The overall classification accuracy rate is between 0.80–0.85. These values suggest that the RIT cut scores are good at classifying students as proficient (*Meets Grade Level*) or not proficient on the STAAR EOC assessment.

Although the results show that MAP Growth scores can be used to accurately classify students as likely to be proficient on the STAAR EOC tests, there is a notable limitation to how these results should be used and interpreted. The STAAR EOC and MAP Growth assessments are designed for different purposes and measure slightly different constructs even within the same content area. Therefore, scores on the two tests cannot be assumed to be interchangeable.

**Table 3.10. Classification Accuracy Results**

N	Proficient Cut		Class. Accuracy	Rate		Sensitivity	Specificity	Precision	AUC
	RIT	State		FP	FN				
STAAR Algebra I & MAP Growth Mathematics 6+

STAAR English II & MAP Growth Reading 6+									
4,852	218	4000	0.81	0.22	0.16	0.84	0.78	0.83	0.89

*Note.* Class. Accuracy = overall classification accuracy rate; FP = false positives; FN = false negatives; AUC = area under the ROC curve.

### 3.5. Proficiency Projections

Table 3.11–Table 3.15 present the estimated probability of achieving *Meets Grade Level* performance on the STAAR EOC tests based on RIT scores from fall, winter, or spring. Due to measurement errors in all test scores, the *Meets Grade Level* MAP Growth cuts do not guarantee that a student will reach proficiency on the STAAR EOC tests. Instead, they indicate a 50% chance that a student will achieve a particular performance level. Therefore, these projections further elucidate the *Meets Grade Level* cut scores by providing the likelihood of reaching proficiency on the state test in the spring at a given percentile throughout the year. For example, an educator can use Table 3.11 to estimate that a grade 7 student who obtained a MAP Growth mathematics RIT score of 227 in the fall has a 50% probability of reaching *Meets Grade Level* or higher on the STAAR EOC test in the spring.

**Table 3.11. Proficiency Projections Based on RIT Scores—Algebra I & Mathematics 6+**
